# PCPCC Center for eHealth Information Adoption and Exchange

April 16, 2008

John Agwunobi, MD – Co-Chair

David Nace, MD – Co-Chair

# Overview / Introduction

- Assure that a person's relevant health data can be made available when needed at the primary care level from various sources, including pharmacies, PBMs, clinical labs, nurse practitioners in retail clinics, hospitals and other medical practices.

# Core Principles

- Health data and information must be accessible to primary care medical home practices, physicians, and patients
- Standards, protocols, and rules for health data exchange on the network should be fully open and supportive of data portability and interoperability
- Information technology will support the enhanced practice efficiency and quality of care that is required by the PCMH model
- No proprietary mandates that would limit information flow or interoperability
- Confidentiality of data is imperative
