

## CONNECTING FOR HEALTH COMMON FRAMEWORK

---

Resources for Implementing Private and  
Secure Health Information Exchange

# National Committee on Vital and Health Statistics

July 17<sup>th</sup>, 2007  
Carol C Diamond MD, MPH  
Managing Director, Health  
Markle Foundation  
Chair, Connecting for Health

# Key Points

1. Time to reset our definitions and assumptions about health data
2. Need to articulate new, broadly accepted working principles
3. Need to develop an information policy framework that broadly addresses public hopes and concerns

# Connecting for Health...*A Public Private Collaborative*

- Convened and operated by the Markle Foundation since 2002
- Works to accelerate the development of a health information-sharing environment to improve the quality and cost effectiveness of health care
- Brings together private, public, and not-for-profit groups
- <http://www.connectingforhealth.org>

# Areas of Focus

1. Technology Standards and Adoption
2. Policy Framework for Successful Implementation
3. Role of the Consumer

*They all matter and they are all necessary*

# Our Journey

- Connecting for Health Roadmap June 2004:
  - decentralized and open standards-based information network
  - proposed a “Common Framework” of privacy and technology attributes that accepts and encourages local variation and innovation while achieving interoperability and portability across geographic regions
  - based on a framework of privacy and built on a model of trust
- In April 2006, CFH Common Framework was fully documented and tested in a prototype implementation in Boston, Indianapolis and Mendocino County, California.

# Connecting for Health Now Focusing on Population Health

- CFH recognizes vital role of data derived from populations for research, quality measurement, public health
- In extensive interviews, serious concerns about current approach in each sector
- Yet a shared vision ...

# Common vision from diverse leaders

- “Research should be a normative part of health care...every intervention with a patient is a chance to learn something”
- “The data must be incorporated with decision support and re-measurement not an episodic hiccup of a data dump”
- “I have been saying this for 20 years...where is the feedback loop folks?”
- “The only way to improve a process is to extract information from that process and send it back to the person”

# The point of population health is to make better clinical decisions at the point of care

*“In the past 50 years we have made substantial progress in understanding the biology of disease and in devising new ways to prevent or treat it. However, there has been a substantial lag in applying what we know to actual patient care.”*

Claude Lenfant

Clinical Research to Clinical Practice -- Lost in Translation?

N Engl J Med 2003 349: 868-874

## THE PHYSICIAN

I AM A PHYSICIAN IN A SMALL  
FOUR-DOCTOR INTERNAL  
MEDICINE PRACTICE IN A SMALL  
SUBURB

TWO OF US  
HAVE BEEN IN  
PRACTICE FOR  
ABOUT 20  
YEARS

AND THE OTHER  
TWO ARE ONLY  
2 YEARS OUT OF  
INTERNAL MEDI-  
CINE RESIDENCY.

WE'LL BE HIR-  
ING TWO MORE  
PHYSICIANS  
THIS YEAR.

?

SHE IS COMING TODAY TO DISCUSS SWITCHING TO AN **ORAL HYPOGLYCEMIC\*** THAT CAME ON TO THE MARKET ABOUT 18 MONTHS AGO, AND FOR A WORSENING COUGH THAT LINGERED SINCE A RECENT BOUT WITH THE FLU

\*STUDIES HAVE SHOWN THAT CERTAIN PATIENTS DO MUCH BETTER ON THIS MEDICATION IF THEY FALL INTO A **GENETICALLY DETERMINED SUBSET** OF PATIENTS WHO HAVE SPECIFIC RISK FACTORS. A SIMPLE BLOOD TEST CAN DETERMINE WHETHER SHE IS GENETICALLY ELIGIBLE FOR THE MEDICATION - BUT EVEN THEN, THE RECENT LITERATURE SUGGESTS THE DRUG WILL ONLY WORK IN THOSE PATIENTS WHO FIT A SPECIFIC SET OF CHARACTERISTICS.

! BASED ON DATA COLLECTED ABOUT THE DRUG OVER THE LAST 18 MONTHS FROM PHYSICIANS AND PATIENTS USING IT, MY INFORMATION SYSTEM SUGGESTS THAT THIS MEDICATION MIGHT WORK WELL FOR THERESA. ...

... IT'S ALSO NOTED THAT A STATISTICALLY SIGNIFICANT NUMBER OF PATIENTS TAKING THIS DRUG REPORT **FATIGUE** - SOMETHING THAT I DISCUSS WITH HER. THE FINGER PRICK BLOOD TEST SHOWS SHE IS INDEED **GENETICALLY ELIGIBLE**, SHE FITS THE RISK FACTOR PROFILE. I THINK WE HAVE A PLAN.

Tom Berthoin 2007

## THE CONSUMER

ANGELA MORENO LIVES IN DAYTON, OHIO, WITH HER 9-YEAR OLD SON, MARTIN

MARTIN HAS MODERATE TO SEVERE **ASTHMA**, WHICH HAS BEEN HARD TO CONTROL. IT INTERFERES WITH HIS SCHOOL PERFORMANCE AND, OFTEN, HIS ABILITY TO SLEEP. HE SKIPS SPORTS

?

HOW SHOULD THE FDA APPROVE THIS DEVICE? SHOULD CMS REIMBURSE ALL IMPLANTS? HOW WILL PRIVATE HEALTH PLANS APPROVE OR REVIEW USE?

**THE POLICY-MAKER**

HEALTH PLANS BOTH PUBLIC AND PRIVATE WANT TO ANALYZE A NEW, IMPLANTABLE RENAL NANO-DEVICE THAT HAS RECENTLY COMPLETED CLINICAL TRIALS AND SHOWN GREAT BENEFIT FOR MANY PATIENTS WITH KIDNEY FAILURE, PREVENTING THE NEED FOR DIALYSIS OR KIDNEY TRANSPLANT.

**\$40K**

THE COST OF THE DEVICE AND THE RELATED SURGERY AND CONTINUED MONITORING AVERAGES \$40,000 PER PATIENT PER YEAR,

AND PATIENTS MUST REMAIN COMPLIANT WITH A NEW ORAL MEDICATION TO AVOID SERIOUS COMPLICATIONS

AS MANY AS 12 MILLION AMERICANS COULD GAIN SOME BENEFIT FROM THE THERAPY, AND AT LEAST 1 MILLION WOULD PROMPTLY GAIN THE POTENTIAL TO LEAVE DIALYSIS OR TRANSPLANT WAITING LISTS

# Time to reset the paradigm?

- Primary vs. Secondary Use
- Consent and Opt-in vs. Opt-out
- The “Lock Box”

# 1. Primary and Secondary Use

- **Primary use** is data collected about and used for the direct care of an individual patient. **Is this all we need for the high quality care of an individual patient?**
- **Secondary use** is non-direct care use of personal health information including but not limited to analysis, research, quality/safety measurement, public health, payment, provider certification or accreditation, and marketing and other business including strictly commercial activities. (e.g. everything else) or “non-clinical” uses
- *Are we basing our policy discussions on broken assumptions that perpetuate historical gaps in the knowledge required to achieve high quality clinical care?*
- *This linear thinking may be an artifact of a paper world.*

# Closing the Loop

- Health information should flow in a continuous virtuous circle
- Policy process should not create “camps” arguing clinical vs. population value of information.
- Policy framework should protect individual rights and society’s interests by articulating appropriate and inappropriate uses in a context of notification and control

## 2. Consent

- Not a magic bullet
- Consenting to what?
- Consent, alone, does not protect privacy
  - Rather, a suite of interdependent policy and technology tools
  - Subject to operational or “real-world” limitations
- Need to address consent in the context of a broad framework of information policies, privacy protections and consumer empowerment

# Connecting for Health Common Framework

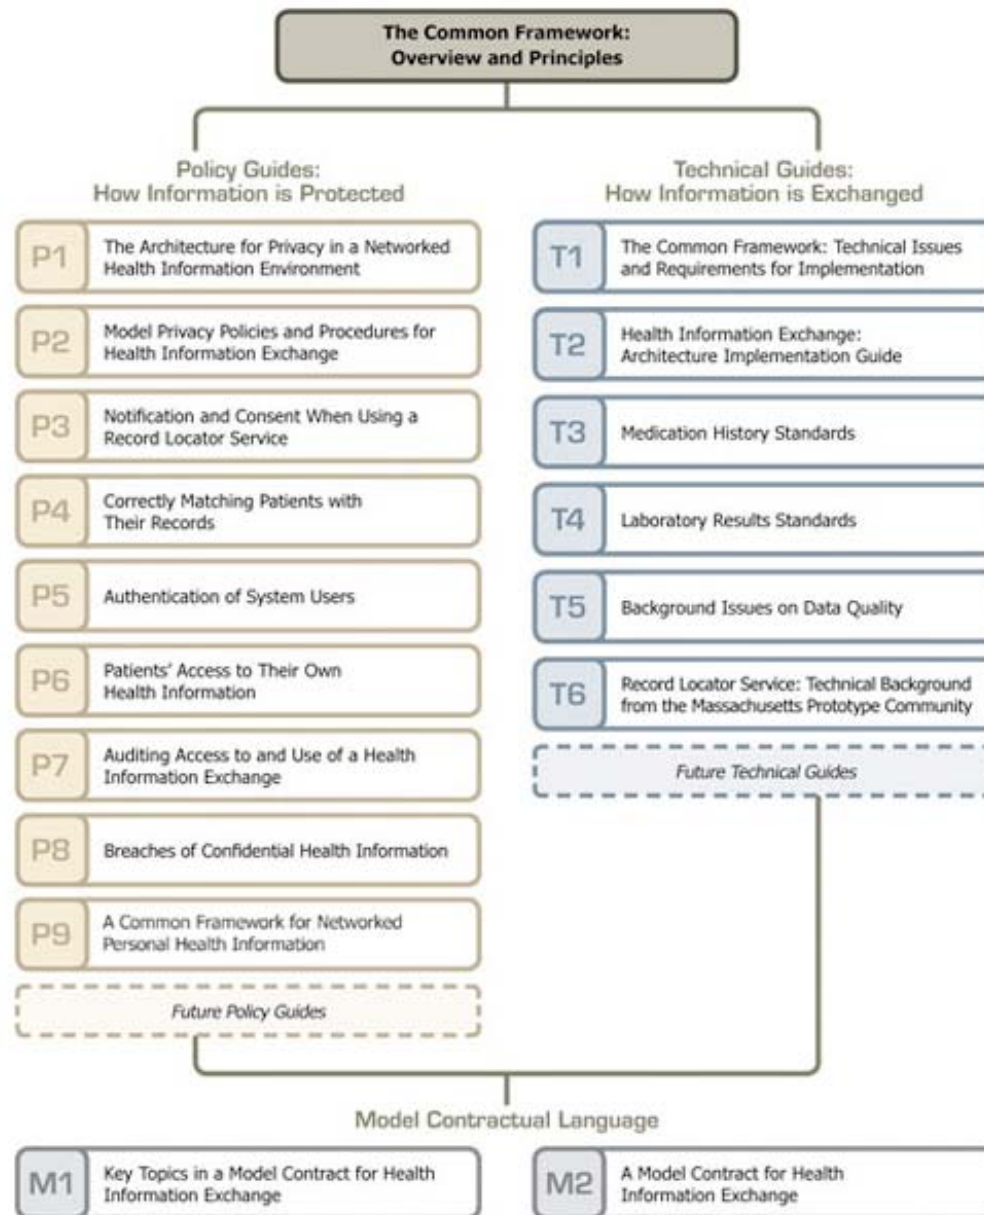

## Technical Principles

1. Make it “Thin”
2. Avoid “Rip and Replace”
3. Separate Applications from the Network
4. Decentralization
5. Federation
6. Flexibility
7. Privacy and Security
8. Accuracy

# Connecting for Health Common Framework

## Privacy Principles

1. Openness and Transparency
2. Purpose Specification and Minimization
3. Collection Limitation
4. Use Limitation
5. Individual Participation and Control
6. Data Integrity and Quality
7. Security Safeguards and Controls
8. Accountability and Oversight
9. Remedies

# Common Framework Attributes

1. A Decentralized, Distributed Architecture
2. Separate Demographic from Clinical Data on the Network
3. Maintain a Flexible Platform for Innovation to Enable Interoperability
4. Implement Privacy through Technology (Audit, Access, Authorization, Authentication, Accuracy)
5. Nine Foundational Privacy Principles

## 3. The “Lock Box”

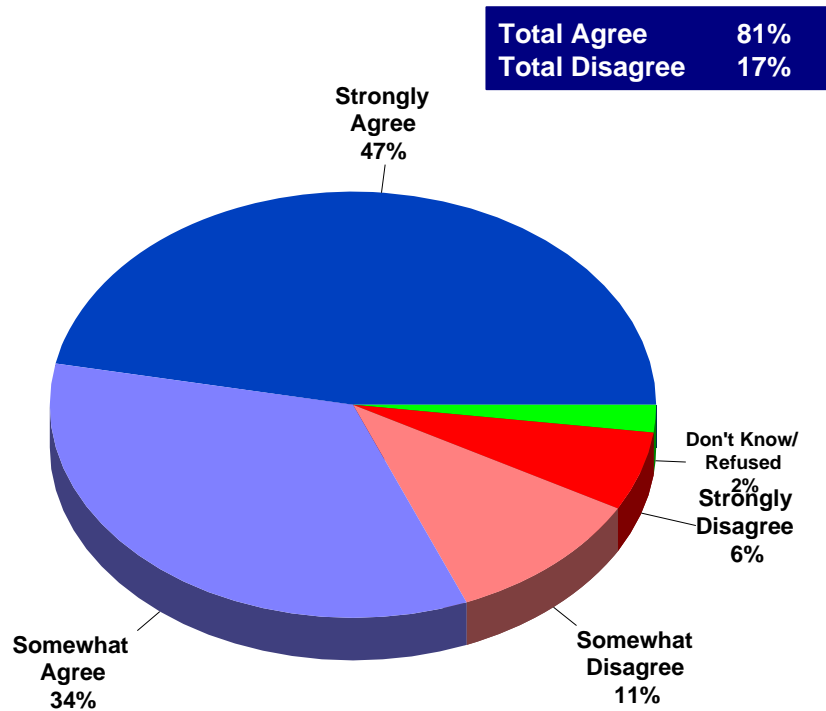

- Another artifact of paper-based or mainframe thinking.
- In a networked environment we are discussing copies of information.
- You can't source delete.

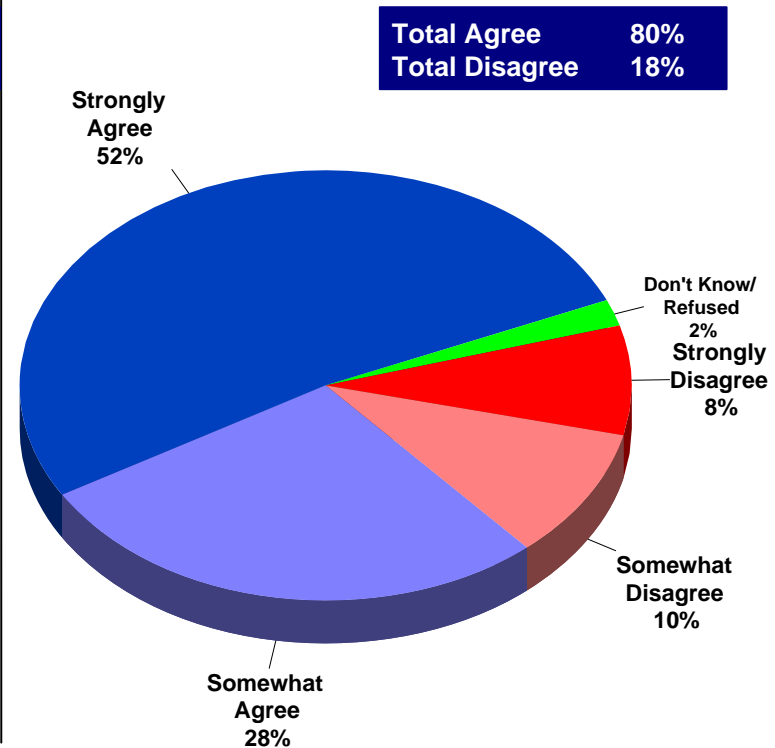

# Articulating New Foundational Principles

# Four in five Americans believe if physicians kept electronic medical records on their patients, health care quality would improve and medical errors would be reduced.

*Allow medical experts to review millions of anonymous health records to determine what treatments work best for different diseases. This would allow your doctor to have the most up-to-date medical information and expand their knowledge about different treatments and diseases.*

*Improve health care quality because it would help reduce medical errors because doctors would be able to retrieve a patient's complete medical history in a matter of seconds.*

*Now let's imagine that doctors were required to keep electronic medical records of their patients. I am going to read you a list of statements you might hear about this, please tell me whether you agree or disagree with each statement.*

# Americans recognize the “upside”... and the “downside”...

- Significant concern about privacy and security
  - 85% say protecting confidentiality absolutely essential
  - FACCT survey: 91% “very concerned” (barrier for 1/4)
  - Strong desire to “control” who sees health information
- Fear of misuses
  - 52% believe employer uses medical info to affect personnel or insurance benefits (CHCF Survey 2005)
  - 85% believe if genetic test results known to insurers, would refuse policies or charge more (Genetics and Public Policy Center Survey 2007)
- Three-quarters of Americans are willing to share their personal information to help public officials look for disease outbreaks and research ways to improve the quality of health care if they have safeguards to protect their identity (Markle Survey 2006).

# “Patients, privacy and trust: patients’ willingness to allow researchers to access their medical records”

Laura J. Damschroder,, Joy L. Pritts, Michael A. Neblo, Rosemarie J. Kalarickal, John W. Creswell, Rodney A. Hayward

- Willingness to share  $\neq$  willingness to cede control
- Veterans want a say in deciding how their medical records can be used for research  
...and in *whether* their records are used
- Veterans were most willing to share their medical records with VA researchers and placed highest level of trust in them
  - Compared to other entities
- Higher trust means less stringent consent procedures

Social Science & Medicine 64 (2007) 223–235

# Connecting for Health

## Draft First Principles for Population Health

# How were these pulled together ?

- *The Connecting for Health Common Framework (2006),*
- Population Health Visioning Scenarios (Cartoons),
- March 2007 Steering Group meeting,
- Steering Group Interviews conducted earlier this year,
- *Roadmap on Achieving Electronic Connectivity (2004).*

# Connecting for Health: Draft First Principles for Population Health

## 1. Designed for Decisions

A 21<sup>st</sup> century health information environment will focus on improving the decision-making ability of the many actors in the health sector. Information technology provides value to health and health care by bringing timely, accurate, and appropriate information to a decision-maker at the right time and in the right way. Data collection alone does not lead to better decisions – indeed, too much or poorly organized data can distract us from filtering up to the most useful information upon which to base a given decision.

# Connecting for Health: Draft First Principles for Population Health

## 2. Designed for Many

**A 21<sup>st</sup> century health information environment should empower a rich variety of users.** The network can feed analytic tools in many settings and provide value to millions of users – to consumers, families, health professionals, policy makers, public health officials, scientific investigators, and many others. The technical and policy framework for the network should anticipate the diverse requirements of this array of users – much like the Internet itself.

# Connecting for Health: Draft First Principles for Population Health

## 3. Shaped by Public Policy Goals & Values

The 21<sup>st</sup> century health information environment should achieve society's goals and values – such as to improve the health of individuals; to make the care delivery system more effective, safe, and efficient; to reduce and manage threats to public health; to respect confidentiality; and to increase scientific knowledge. The network serves both the personal care setting and public needs and values. It is obliged to respect and further public values such as individuals' ability to control the use of their information. Such policy and public values must be made explicit and subjected to public discussion, and then architected into the technology at the outset.

# Connecting for Health: Draft First Principles for Population Health

## 4. Boldly Led, Broadly Implemented

A 21<sup>st</sup> century health information environment should be guided both by bold leadership and strong user participation. The network's value expands dramatically with the number of needs it can meet and the number of participants it can satisfy. The network is not bound, for example, by a hospital's walls or the parameters of a research grant. A forward-looking generation of health care will know that they are not building information systems to keep data from competitors or to deprive others of the opportunity for insight, but that they are contributing to a diverse, flexible, and expansive body of knowledge. Value will be created by those who are most skilled at accessing the right information, applying the right intelligence, and solving the right problems. New health care leaders must come together with a common vision to develop an architecture and policy framework that facilitates this kind of information environment.

# Connecting for Health: Draft First Principles for Population Health

## 5. Possible, Responsive and Effective

A 21<sup>st</sup> century health information environment should grow through realistic steps. Overly complex or ambitious technology can exacerbate the problems we face, or introduce new ones. It is therefore essential to seek realistic steps towards the ultimate vision of a responsive, nimble system to enhance decision-making.

# Connecting for Health: Draft First Principles for Population Health

## 6. Distributed but Queriable

A 21<sup>st</sup> century health information environment should be comprised of a large network of distributed data sources. It should be possible to query across all of these sources without needing a central structure. We must avoid replicating (or even exacerbating) the current problem of uncoordinated health data silos, which result from duplicative efforts to build repositories and analytic systems, often from the same data sources.

# Connecting for Health: Draft First Principles for Population Health

## 7. Trust through Safeguards and Transparency

A 21<sup>st</sup> century health information environment should earn and keep the trust of the public through policies that provide safeguards and transparency. Americans will support sharing their sensitive health information across the Internet if they trust in the security, privacy, and appropriate uses of the network. Such trust can be established through a combination of safeguards (including both technical and non-technical approaches) and transparency (of both decision-making process and practice). The technical architecture will include tools to protect data against break-ins and theft, to provide anonymization, and to prevent data corruption or errors. The policy architecture will develop clear rules and guidelines through an inclusive and transparent ongoing process.

# Connecting for Health: Draft First Principles for Population Health

## 8. Layers of Protection

The 21<sup>st</sup> century health information environment should protect patient confidentiality by emphasizing the easy movement of queries and responses, rather than of raw data. The level of protection should be scaled to the risks, with identifiable data achieving the highest levels of protections. Many classes of authorized users should be able to send standardized queries across the network, allowing appropriate data sources to respond with aggregated or anonymized “answers” without compromising personally identifiable data. When requirements for additional identifiers are appropriate, additional levels of protections should be applied.

# Connecting for Health: Draft First Principles for Population Health

## 9. Good Network Citizenship

A 21<sup>st</sup> century health information environment should encourage and enforce good network citizenship by all participants. Health sector leaders should take steps to increase the appropriate movement of health information and discourage those who pursue unauthorized uses. To receive public funding or to be welcome in various information exchange initiatives, participants must abide by both the technical and policy rules that permit the larger national network to function. There must be accountability and strong mechanisms for adequate enforcement associated with these requirements and commitments. These rules must provide for auditing and assignment of liability and mechanisms for redress.

# Developing a New Information Framework

# A starting point...(for a complex task)

- Reset the terminology to support the desired paradigm
- Emphasize that health and health care improvement depends upon information continuity and availability across health and health care in a climate of trust
- Engage stakeholders in constructive, forward-looking process towards a shared vision that addresses both the policy and technology framework
- Identify the risks and classes of information misuse and the classes of technology and policy protections available
- Urge that the framework establish the policy and technical requirements that any Federally-sponsored work on population health must achieve
