

Advising the Secretary of Health and Human Services on health information policy since 1949.

Privacy, Confidentiality and Security Subcommittee June 15, 2016

- A. Summary of Hearing on De-Identification and the Health Insurance Portability and Accountability Act (HIPAA)" May 24-25, 2016
- B. Preview of Hearing on Minimum Necessary and HIPAA, June 16
- **C.** 18 month priorities for the PCS Subcommittee

Advising the Secretary of Health and Human Services on health information policy since 1949.

De-identification Hearing Objectives:

- Increase awareness of current and anticipated practices such as the sale of information to data brokers and other data-mining companies for marketing and/or risk mitigation activities;
- 2. Understand HIPAA's de-identification requirement in light of these practices, and
- 3. Identify areas where outreach, education, technical assistance, a policy change, or guidance may be useful.

Overarching Themes

- 1. There is a "privacy-data collision"
- 2. Few agreed upon processes for de-identification and managing de-id data
- 3. Divergent views of problem/issues
- 4. Expanding data science research
 - Raise the sophistication of current practice
 - Translation and spread into practice
- 5. Value of use cases for education
- 6. Further guidance or a change to regulation
 - Adding genomics
 - Suite/tier of methodologies
 - Lifecycle/Data Stewardship
 - Controls

Take Aways -I

- Every data set presents different de-identification challenges
- De-identified data does not stay de-identified
- Need for physical, technical and administrative solutions
 - Depends on data, recipient, context
- Suggestion for a controlled study of the efficacy of Safe Harbor
- Policy incentives to improve application of de-identification techniques and/or tools

Take Aways - II

- Need a workable definition of re-identification
- Different rules depending on recipient
- Current methods depending on recipient
 - For direct access = licensing and security
 - For dissemination = de-identification
 - Query-based = now limited to differential privacy
- Laws are based sector-specific, data in different environments treated differently
- De-identification worthwhile given changes in technology; useful, but not sufficient, may need other restrictions

More Take Aways - III

- Options for mitigating risk of re-identification
 - Synthetic data sets
 - Enclaves (Semi-trusted analytic 'sandbox')
 - Secure multi-party computing
- Desire to address provenance of data
- Need to limit burden on research
- Limited use v. public use data
- More de-identification v. more utility
- Data Use Agreements move enforcement from regulatory realm to contract enforcement
- De-identified PHI has no restriction on re-identification
- Too focused on de-identification alone v. spectrum of disclosure limitations, techniques and tools

Panel 1: Policy Interpretations

- Complexity of de-identifying narrative data v. unstructured data
- Risk means something different to everyone
- Who is responsible for certifications when multiple data sets integrated? Which expert controls?
- Formalists and pragmatists don't meet/talk
- No standardization of cell suppression
- No standard for minimizing risk

Panel 1: Policy Interpretations

- No oversight of de-identified PHI -- "ludicrous"
- Time-limited certification of a data set under safe harbor or expert analysis
- Education of IRBs in de-identification science
- Agreement on what constitutes a "small risk" under HIPAA
- Clearinghouse for best practices in de-identification practice
- Process for minimizing risk similar to data security policy
- Tiered access levels of data
- Economic incentives for adopting policy
- Adding a provision to Data Use Agreements prohibiting reidentification

Advising the Secretary of Health and Human Services on health information policy since 1949.

Panel 2: De-Identification Challenges

- Citizen scientists, not covered
- Individuals want > control \rightarrow access
- Need for more robust risk assessment tools, processes
- Risk of propagating existing biases in data
 - Drawing inaccurate inferences
- Governance and ethics discussion
- We're bad at talking about risk, societal values
 - Risk of harm v. statistical risk of re-id v. benefits
 - Reputational v. economic v. bodily v. other?
- Technology alone is not the solution

Advising the Secretary of Health and Human Services on health information policy since 1949.

Panel 2: De-Identification Challenges, continued

- Best practices, e.g. life cycle management, audits
- FTC report on Internet of Things
 - Reasonable steps to de-identification
 - Commitment to re-identification
 - Need for enforceable contracts
 - Prohibiting downstream re-identification
- Consideration of "context" of collection, opt=in/opt-out
 - Under what circumstances should individuals be notified of a new use?
- Real v. perceived harm, re-identification is not necessarily actual harm
- Multi-step process for consent

Panel 3: Approaches for De-Identification and Re-Identification

- Separating data set from potential uses
- Machine learning, algorithms respect limits
- Policy chases technology, need for evolutionary policy process
- De-identification conflicts with data exchange regulations
- Lack of resources to audit de-identification
- Vendors want to keep de-identified data to use later
- Look for benefit to patient, then allow re-identification No guidance for going back to data source
- Using pseudo-identifiers common privacy architecture
- Improve linkages for mortality and outcome data, including longitudinal
- Self-reported genomic data can be used to re-identify

Panel 3: Approaches for De-Identification and Re-Identification, continued

- Use cases, e.g., pop health, precision medicine, would be helpful
- Rules need room for innovation
- Consider how partners address privacy especially when linking data
- Need guidance for publishing reports, standards for how to report
- Revisit rules for genetic information regularly (dynamic)
- Policy should anticipate more ways to identify data at later dates
- Improve education on implications of genomic data, other kinds
- Aligning best practices in administration with IRB practices

Advising the Secretary of Health and Human Services on health information policy since 1949.

Panel 4: Models for Privacy-Preserving and Use of Private Information

- Consumer expectations = legal, just, fair
- Increased capture of observational data, e.g., cameras, activity trackers, apps, behavior-related

Advising the Secretary of Health and Human Services on health information policy since 1949.

Panel 4: Models for Privacy-Preserving and Use of Private Information, continued

- Catalogue of privacy controls + calibration to different levels of risk, updating over time such as FISMA controls
- Appropriate controls for each stage of life cycle
- Crosswalk to different standards, e.g., HITRUST framework
- Where no experts on staff -- Catalogue of controls, licensing agreements, expert panels, develop guidance, design for interoperability
- Governance and accountability against a set of social values

Advising the Secretary of Health and Human Services on health information policy since 1949.

Research Impediments

- Expense of obtaining an expert
- Administratively cumbersome to get consents
- Use of safe harbor reduces utility
- Fear of re-identification due to change in technology
- Cumbersome to prepare data collected for one purpose into data useful for a secondary purpose

Advising the Secretary of Health and Human Services on health information policy since 1949.

Minimum Necessary Hearing Objectives—June 16

- 1. Understand current industry policies and practices involving minimum necessary practices;
- 2. Understand challenges and potential areas for clarification in light of these practices, new and emerging technology developments, and new and evolving policy directions since the Privacy Rule became effective, and
- 3. Identify areas where outreach, education, technical assistance, or guidance may be useful.

2016 Subcommittee Workplan
